Specialists in Pediatric and Adult Allergy, Asthma, and Sinus Disease

Arthur F. Fost, M.D. ▪ David A. Fost, M.D. ▪ Antonio A. de la Cruz, M.D. ▪ Satya D. Narisety, M.D.

Gastroesophageal Reflux Disease (GERD) occurs when the acid produced by your stomach moves up into your esophagus. This can cause symptoms such as heartburn, food repeating or a dry cough. Eating large meals or lying down right after a meal can trigger symptoms of acid reflux disease.

These are some of the common foods that trigger acid reflux symptoms:

- Alcohol
- Carbonated beverages
- Chocolate
- Citrus fruits, such as oranges or lemons
- Coffee or tea (regular or decaffeinated)
- Fatty or fried foods
- Foods containing tomato, such as spaghetti sauce, salsa, or pizza
- Garlic and onions
- Mint
- Spicy foods, such as those containing chili or curry

Minimizing the amount of these foods in your diet can help to control the symptoms of GERD.
